Project Name	AI based discourse for Banking Industry

Creating Assistant & Integrate With Flask Web Page

Let us build our flask application which will be running in our local browser as an user interface.

In the flask application, users will interact with the chat bot, and based on the user queries they will get the chatbot responses.

Building Python Code

1: Importing Libraries

The first step is usually importing the libraries that will be needed in the program.

from flask import Flask,render_template

Importing the flask module into the project is mandatory. An object of the Flask class is our WSGI application. Flask constructor takes the name of the current module (name).

2: Creating our flask application and loading

app = Flask(_name)

3: Routing to the Html Page Here, the declared constructor is used to route to the HTML page created earlier.

The '/' route is bound with the bot function. Hence, when the home page of a web server is opened in the browser, the HTML page will be rendered.

Main Function

This is used to run the application in local host.

```
if __name__ == '__main__':
app.run()
```

Building HTML Code

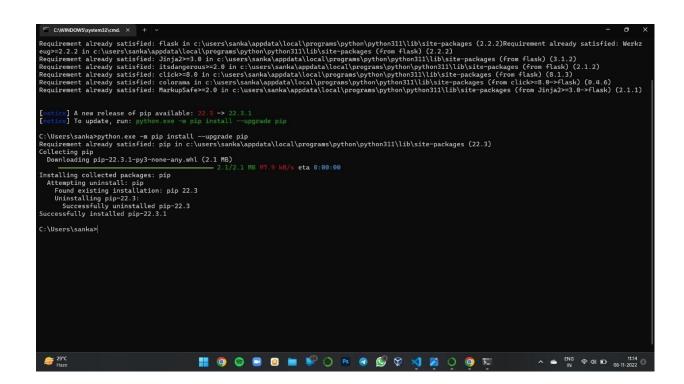

We have used HTML to create the front-end part of the web page.

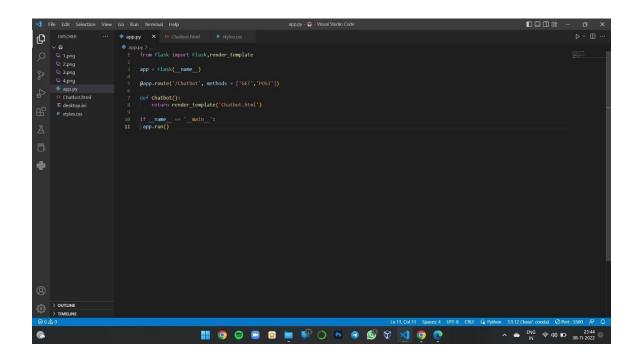

Here, we have created "index.html" displays the home page which gets integrated with Watson Assistant.

Auto-generated source code which contains the Integration ID of IBM Watson Assistants is copied and pasted inside the body tag.

Run the application

- 1. Open Vs Code
- 2. Navigate to the folder where app.py resides.
- 3.Run the python code
- 4.It launches the application integrated with IBM Watson Assistant.

Source code is attached in Final Deliverables.

Note: No code for this project. So, I attached the screenshot and step to build it.
